

TROUBLESHOOTING JUST GOT BETTER WITH CLEARSKY™

With the new Remote Analyzer Reader (RAR) and ClearSky from JLG®, troubleshooting machine issues just got a whole lot easier. Did you know that 40% of the time, service technicians don't have the right parts or tools with them to do the job? Not anymore! More convenient than the handheld analyzer, RAR provides service technicians access to diagnostic machine data in an easily reviewable summary without being on-site. This information is available through the ClearSky portal for most JLG boom, scissor and telehandler models equipped with a CAN device.

Features and Benefits Include:

- **Reduce Costs:** Eliminate or reduce costly service calls; ensure technicians have the right parts and tools for service visits
- **Save Time:** Faster troubleshooting; fewer unnecessary service visits
- **Reduce Revenue Loss:** Machines can stay in service and be available for rent or use
- **Improve Safety:** Provides the data needed to decide whether a machine can continue to be operated safely or needs to be removed from the fleet until service is complete
- **Increase Efficiency:** Technicians arrive with the right parts and tools for service visits; no need for a handheld diagnostic tool

How Does it Work?

From the ClearSky portal, the service tech enters the serial number of the machine; selects the types of diagnostic data needed; and receives a summary sheet featuring key diagnostic information. Technicians can refine data and fault logs by system information, machine setup, personalities, diagnostics, and more. Head out for the service call fully prepared!
